Phase 3: Data Modeling & Relationships

Project: Visitor Check-In System for Offices

1. Standard & Custom Objects

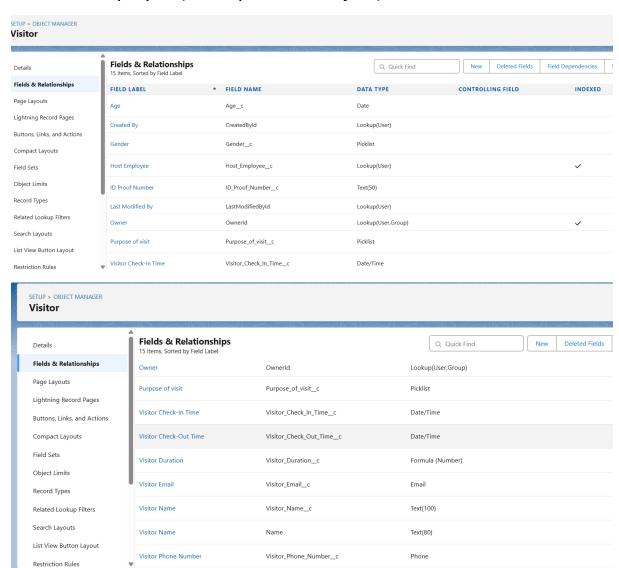

- Standard Objects used: User (Host Employee reference).
- Custom Objects created: Visitor (to store visitor information such as name, phone, email, check-in/out times, etc.), to track specific meetings associated with visitors.

2.Fields

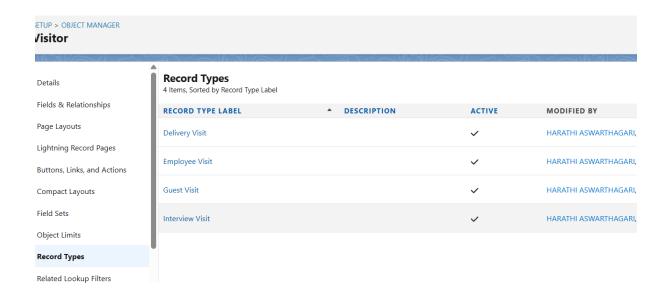

- Visitor Name (Text)
- Visitor Email (Email)
- Visitor Phone Number (Phone)
- Visitor Check-In Time (Date/Time)
- Visitor Check-Out Time (Date/Time)

- Visitor Duration (Formula Number; calculates visit length in hours)
- Purpose of Visit (Picklist)
- Gender (Picklist)
- Age (Date field to store DOB)
- ID Proof Number (Text)
- Host Employee (Lookup to User object)

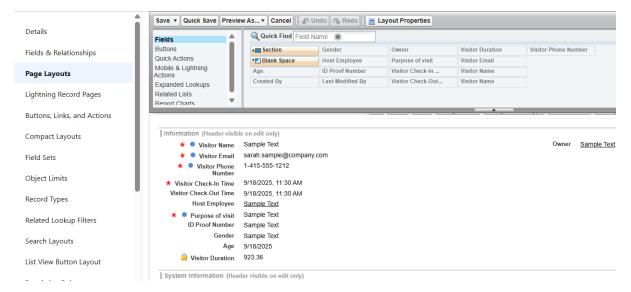

3. Record Types

 Record types were noted but not yet deeply configured (can be extended later for differentiating visit types like (Interview, Guest, Contractor).

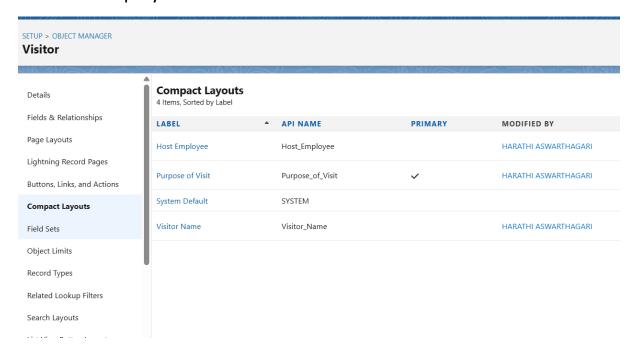

4. Page Layouts

 Edited Visitor page layout to organize fields (Visitor Name, Email, Phone, Check-In, Check-Out, Purpose of Visit, Host Employee, etc.).

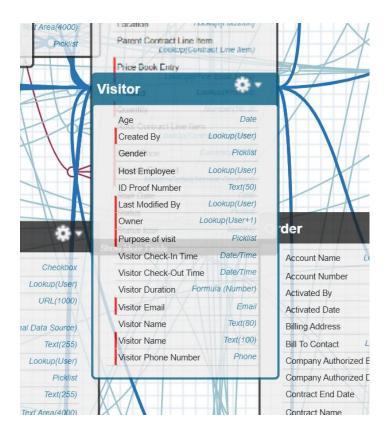

5. Compact Layouts

- Defined a "Visitor Compact Layout" to show key details in highlights panel:
- Visitor Name
- Visitor Phone Number
- Purpose of Visit
- Host Employee

6.Schema Builder

- Opened Schema Builder to visually confirm object relationships.
- Verified Visitor and Visitor Meeting object structures.

7. Relationships

- Lookup Relationship: Visitor → Host Employee (related to User).
 Master-Detail Relationship: Visitor Meeting → Visitor (to tightly bind meetings under a visitor).
- Hierarchical Relationship: Not applicable for Visitor object, since this is only available on the User object.
- Junction Object: Visitor Meeting acts as a junction object connecting Visitor and potentially User (Host Employee), supporting many-to-many scenarios (e.g., one visitor attending multiple meetings with different hosts)

8. External Objects

• Learned about external objects in Salesforce Connect.
